

When getting ready to go on a fishing trip, create custom snells (leader and hook lines) using the LOOPCobra™ and SnellNINJA™. Pick the exact hook you want and the perfect thin line to match your bait and fishing conditions. The snell, or leader, is the most important part of your fishing setup for live bait as it is the part the fish interacts with. Fine, thin and light leaders, or flourocarbon leaders increase your takes and put more fish on the end of your line. The LOOPCobra™ throws a perfect loop every time and FAST. Make the strongest, perfect loops and connect your rigs using the loop-to-loop connection or use a swivel in between. Green Model ties a small and slightly larger loop. Yellow model ties a very small loop and has a micro hook remover at the other end.

1

DOUBLE UP LINE

Double up the line and form a loop. Feed the doubled-up line through the Cobra “chin” as in A. Maintain tension on loop and keep doubled-up line neat as in B. Begin twisting.

2

TWIST 3X FEED LOOP IN MOUTH

After twisting 3x as in C., feed the loop into Cobra Mouth as in D. Wet and pull line tight down to cobra head. Tilt handle and head down so Cobra Head falls back and bottom line will slip out of Cobra Mouth as in “E” then finish loop by pulling tool.

3

REMOVE PERFECT LOOP & TRIM

Work finished loop out of Cobra mouth F. and then trim loose end as shown in G.

4

STORE LOOPS

Use a 9” - 12” plastic coated cardboard with slits cut in each end to make a stroage card. Store your line lengths (leaders) on this. Pull the line the length of the storage card and then tie the loop. All of your line lengths (leaders) should be the exact same length. Make 6 - 12 copies of these line lengths stored on a card to prepare for your fishing day. If you snag or break a length of line or have a fish swallow your hook, you can re-connect another line length (leader) in under a minute. Connect your loop to a swivel for an ultra-strong connection. Use the LOOPCobra™ to make a loop on your line from the rod. Connect swivel to loop and then your hook lengths to this swivel.

TIPS

CLEAR WATER - use 9 - 14” of flourocarbon leader at end of your rig to hide the line from fish. Flourocarbon is clearer than water.

SNAGS - use 6” of lighter line (4 lb. leader vs. 6 lb. main line) and if your hook hangs up, you can give a quick tug and the leader ONLY will break - saving your splitshot, float and majority of your setup!

ZEBRA MUSCLES - use 6” of stronger leader to prevent line cuts in contact with the bottom.
